

The SmartSoil: 4 Phases

PHASE

1

PHASE

2

PHASE

3

PHASE

4

EVALUATION

The first phase is the evaluation process. We begin by collecting crucial data from you, including square footage, soil composition, irrigation costs, maintenance expenses (including the use of wetting agents and fertilizer), and labor costs. Using this data, we calculate projected savings and factor in pricing. SmartSoil Hydrogel costs 0.25 cents per square foot over 5 years, with payments staggered annually based on irrigation and overall costs.

INSTALLATION

We understand the importance of a hands-on approach. Our team guides you through the entire process, ensuring proper application via sprayer and irrigation into the soil. You'll start seeing reductions in water and maintenance costs after just two weeks.

CONSISTENT MONITORING

We actively monitor the locations in which SmartSoil Hydrogel is installed and stay in close touch with you and your team throughout the technology's life. This ensures that your investment in SmartSoil continues to yield optimal results.

ONGOING MAINTENANCE

We conduct bi-annual check-ins to ensure the integrity of the technology. If any issues arise, such as dry spots or underperforming areas, we evaluate soil samples and replace the material for the necessary square footage, ensuring consistent performance. We will remain in this phase throughout the 5 year life span of the tech.
